<u>Proyecto API con Django Rest</u> Framework

```
from django import forms
from .models import AlbumImage

class UploadImageForm(forms.ModelForm):

    class Meta:
        model = AlbumImage
        fields = ['album', 'image']
```

Creamos la función de la vista en mi_proyecto/albums/views.py

```
from django.contrib.auth.decorators import login_required
from django.shortcuts import render_to_response, RequestContext

from .forms import UploadImageForm

@login_required
def upload_image_view(request):
    if request.method == 'POST':
        form = UploadImageForm(request.POST, request.FILES)
        if form.is_valid():
```

<u>Upload de imágenes con Django,</u> mediante formulario

```
from rest_framework import serializers
from rest_framework import status

@api_view(['POST'])
def add_items(request):
    item = ItemSerializer(data=request.data)

# validating for already existing data
    if Item.objects.filter(**request.data).exists():
        raise serializers.ValidationError('This data already exist:

if item.is_valid():
    item.save()
    return Response(item.data)
else:
    return Response(status=status.HTTP_404_NOT_FOUND)
```

https://www.geeksforgeeks.org/django -rest-api-crud-with-drf/

```
from rest_framework import serializers
from .models import Todo

class TodoSerializer(serializers.ModelSerializer):
    class Meta:
        model = Todo
        fields = ('id' ,'title', 'description', 'completed')
```

From the rest_framework package, we import the serializers. We create a class, TodoSerializer that extends from the ModelSerializer class. We then go ahead and specify the model and fields we want to be returned.

Let's also update the todo/views.py:

```
from django.shortcuts import render
from .serializers import TodoSerializer
from rest_framework import viewsets
from .models import Todo

class TodoView(viewsets.ModelViewSet):
    serializer_class = TodoSerializer
    queryset = Todo.objects.all()
```
